# Secrets Manager Rotation for Database Credentials

## Process:

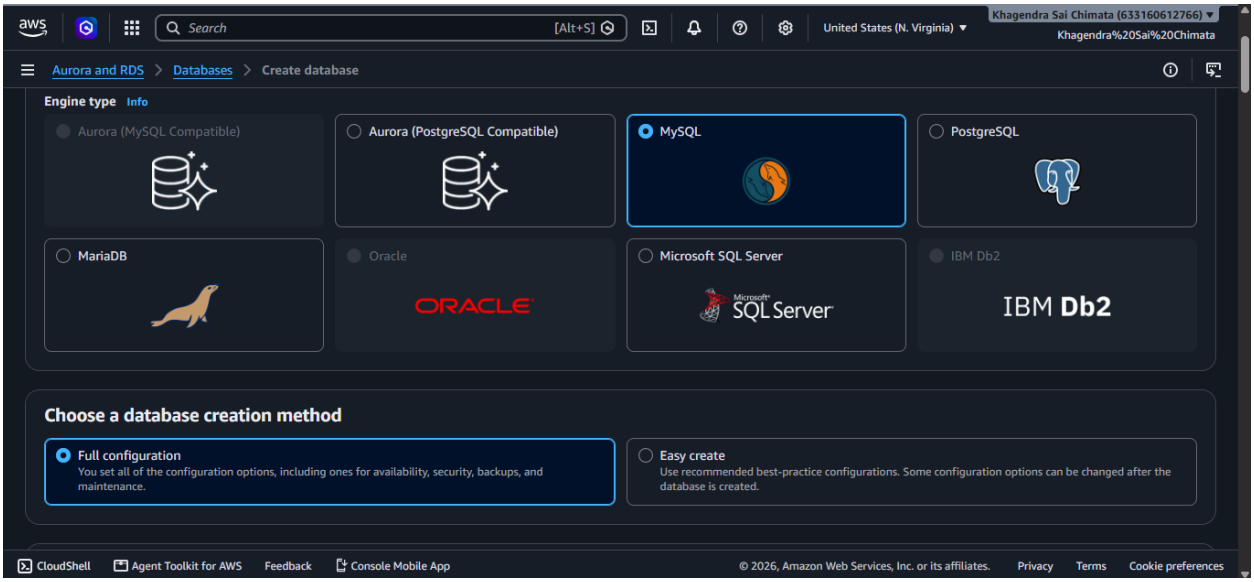

1. Login to the AWS management console and serach for RDS

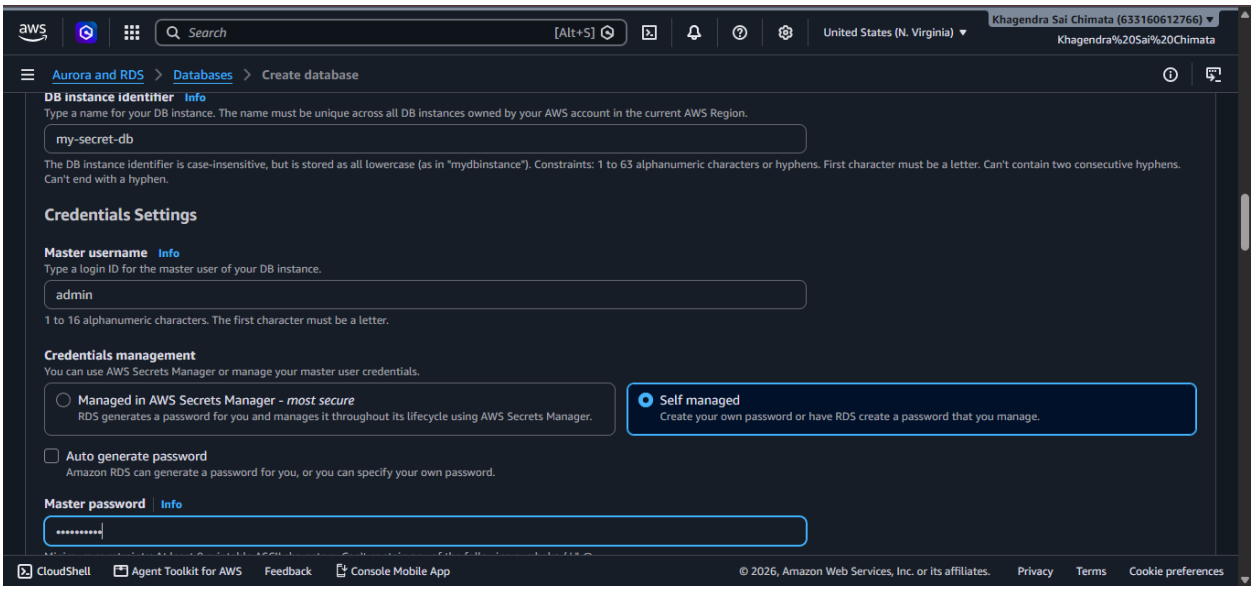

2. Open Databases option and select create database->Full Configuration

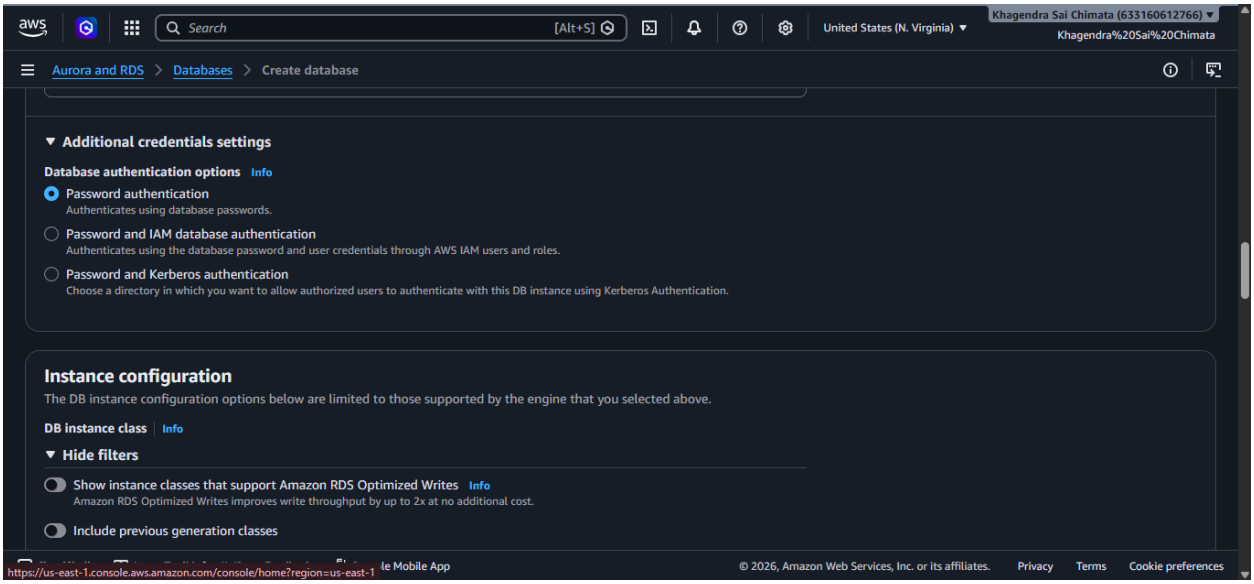

3. Select required engine type such as MySQL and database creation method as Full Configuration so that we cann set all required configurations for the database.

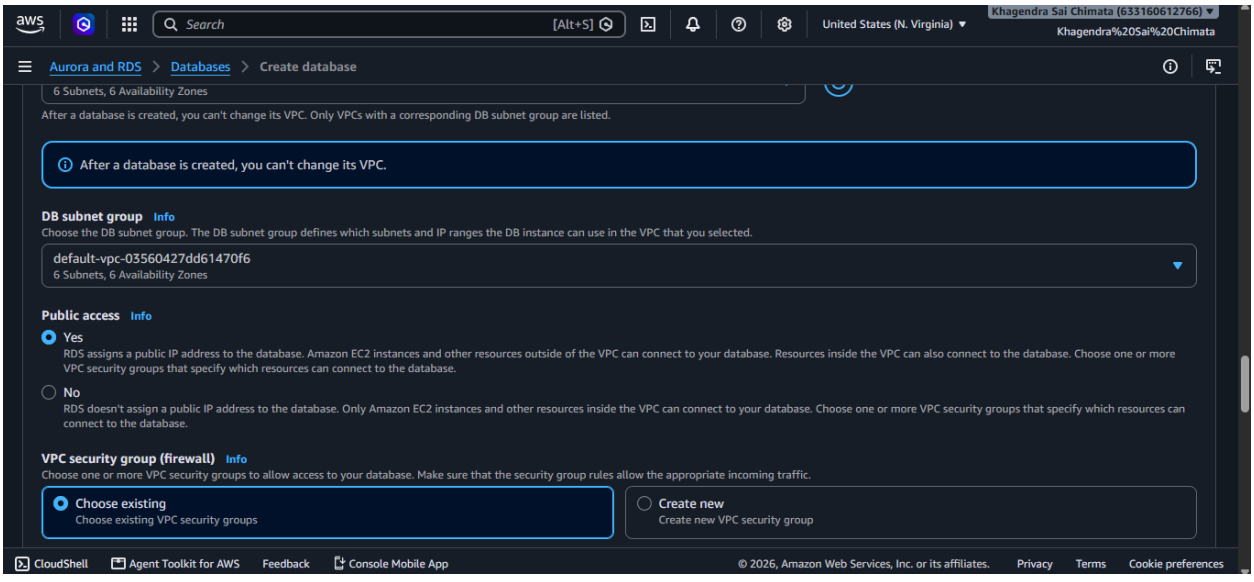

4. Set database identifier and master username and choose password as self managed and create a password.

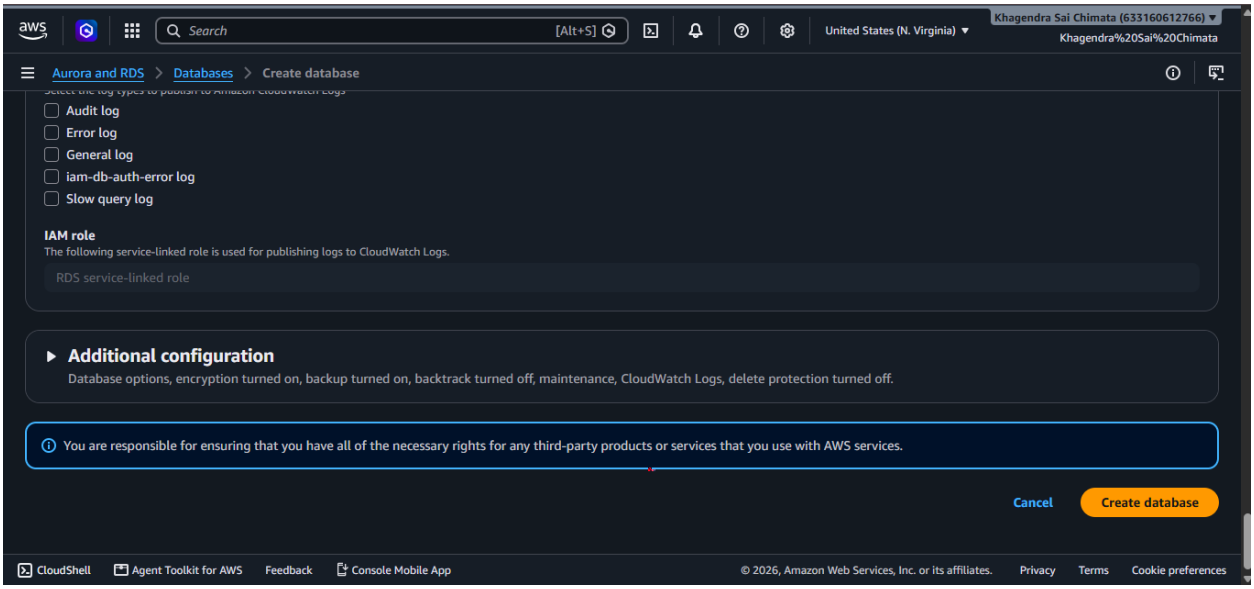

5. Keep the database authentication as Password Authentication.

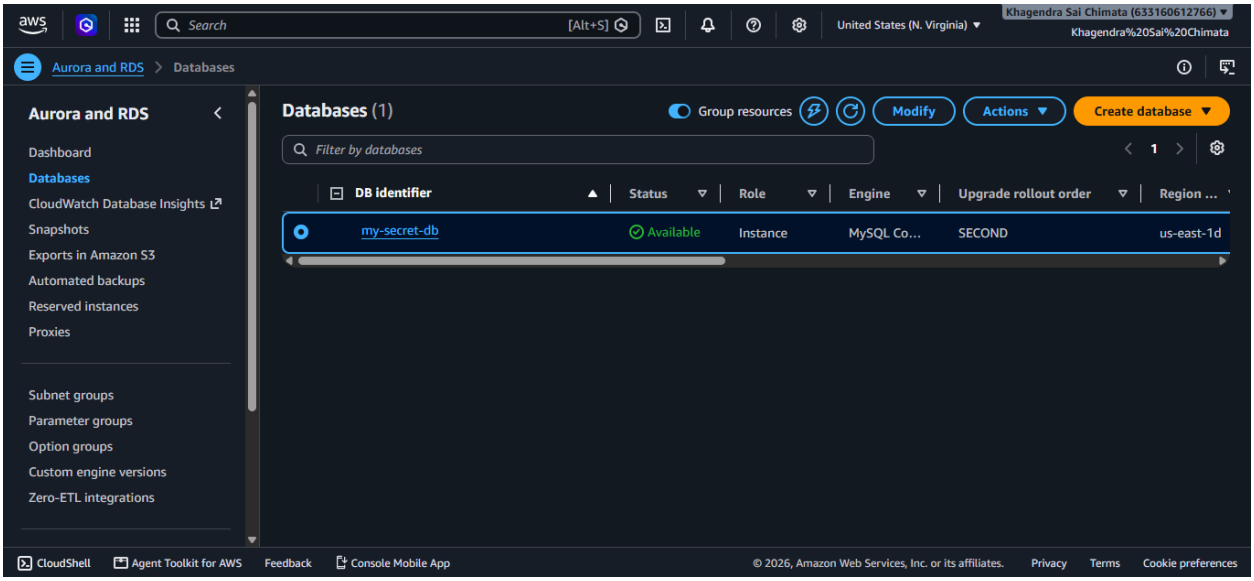

6. In Connectivity option we can select the default VPC, Subnets and security groups and but change public access to yes if we want to connect the database instance through MySql Workbench.

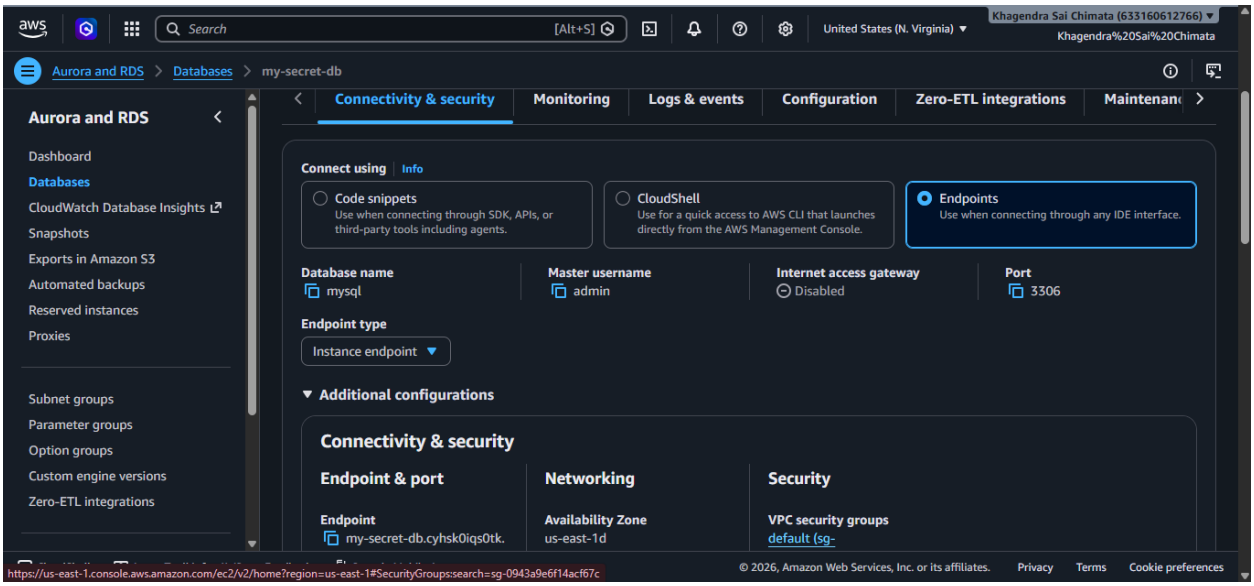

7. Click on Create Database to create the database instance.

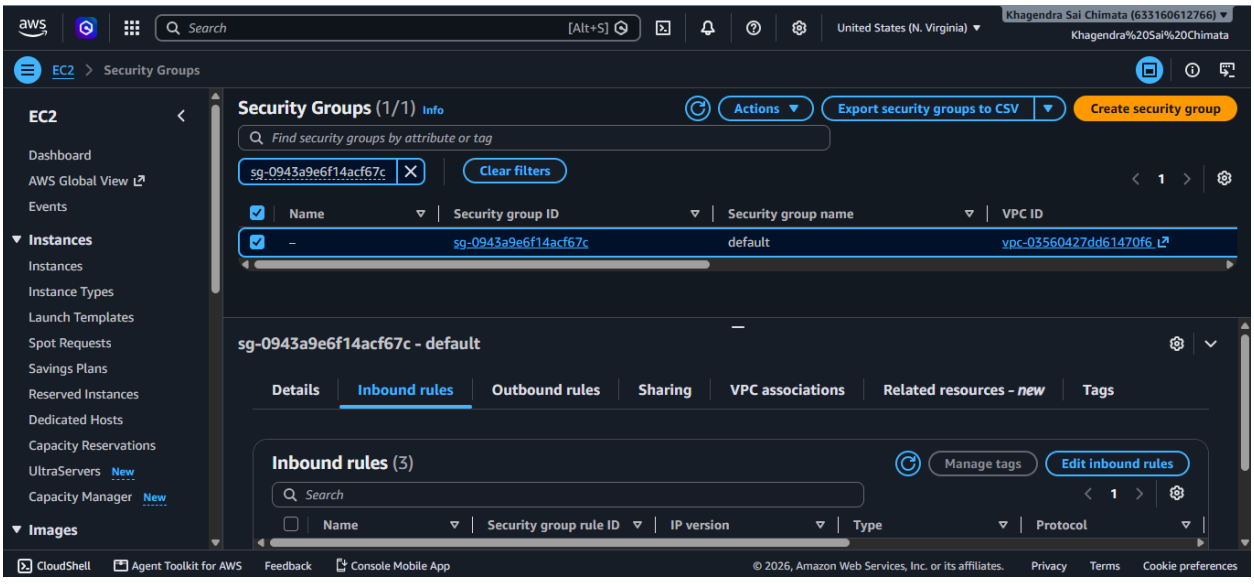

8. The Database is created.

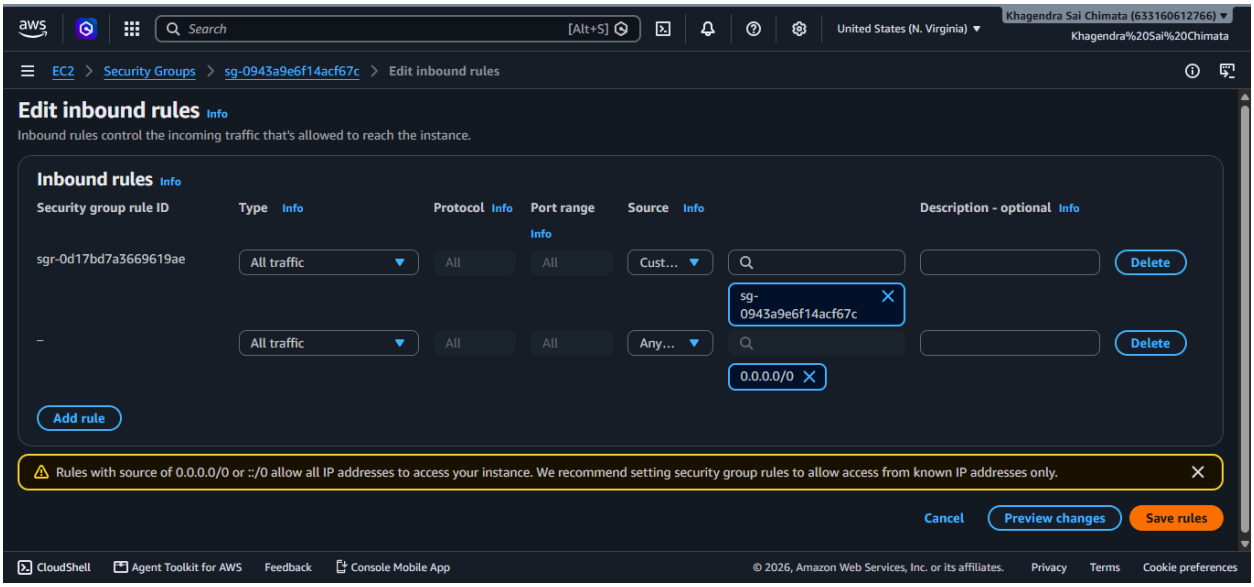

9. Select the database and open the Connectivity and Security option and select the security groups.

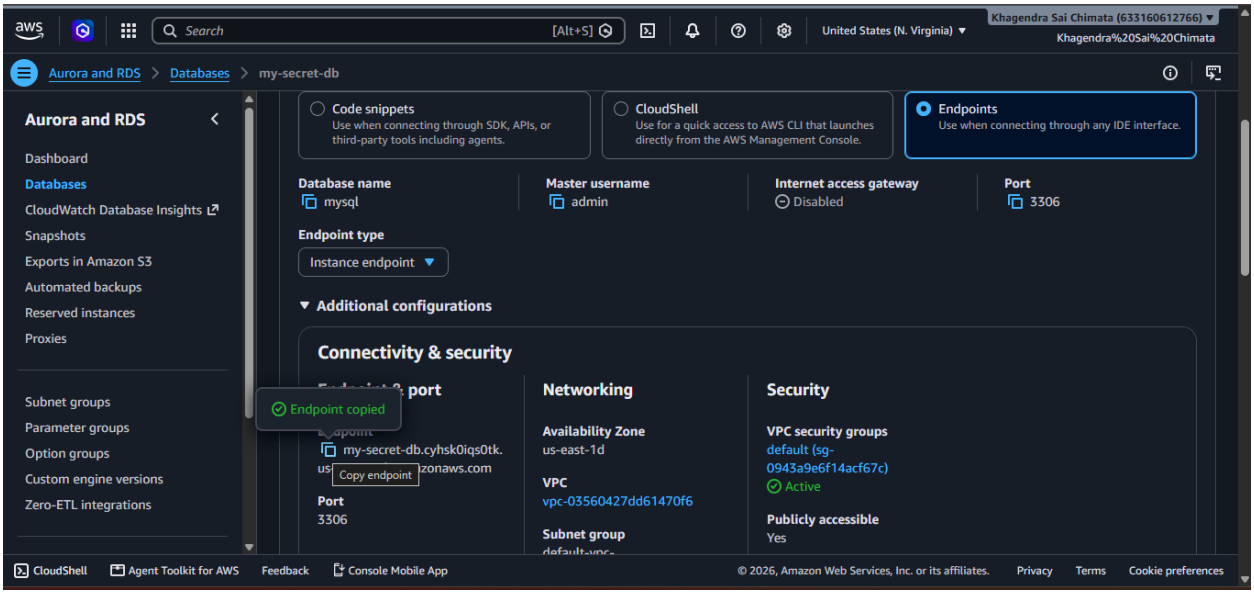

10.Select the Security Group and Open the Inbound rules and select edit Inbound rules option

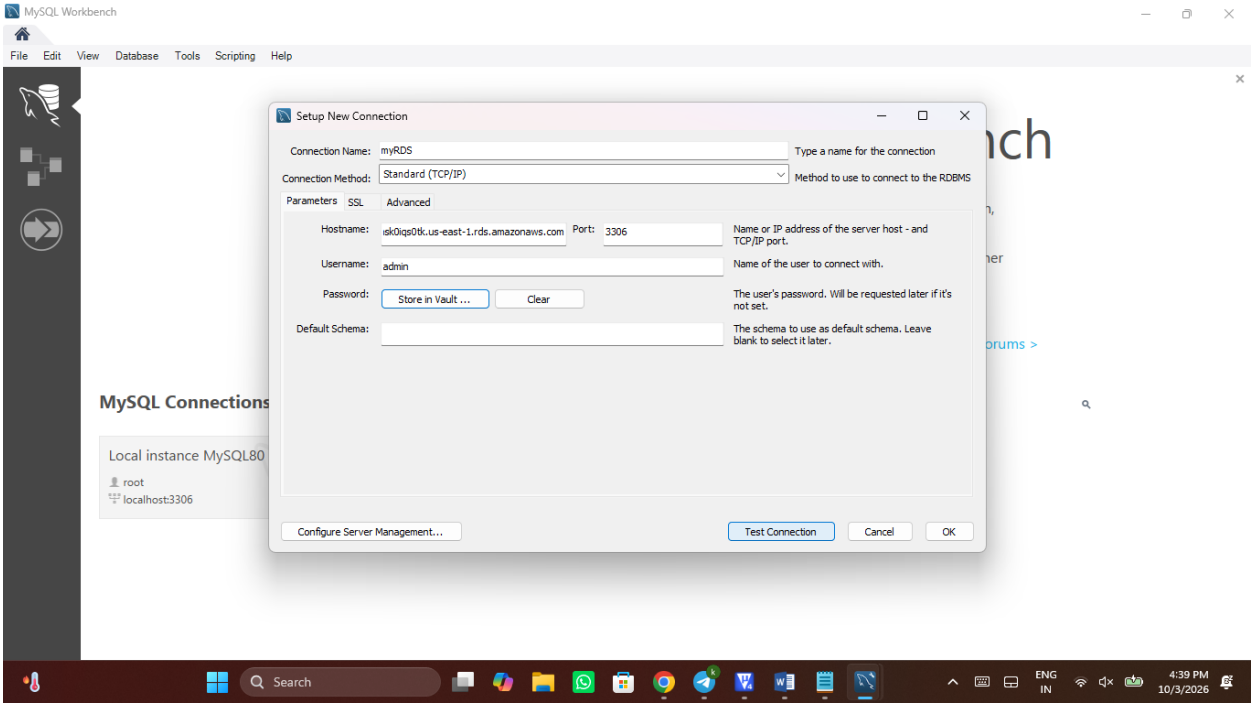

10. Add a new inbound rule so that we connect to the RDS instance using the endpoint from MySql Workbench and click on save rules.

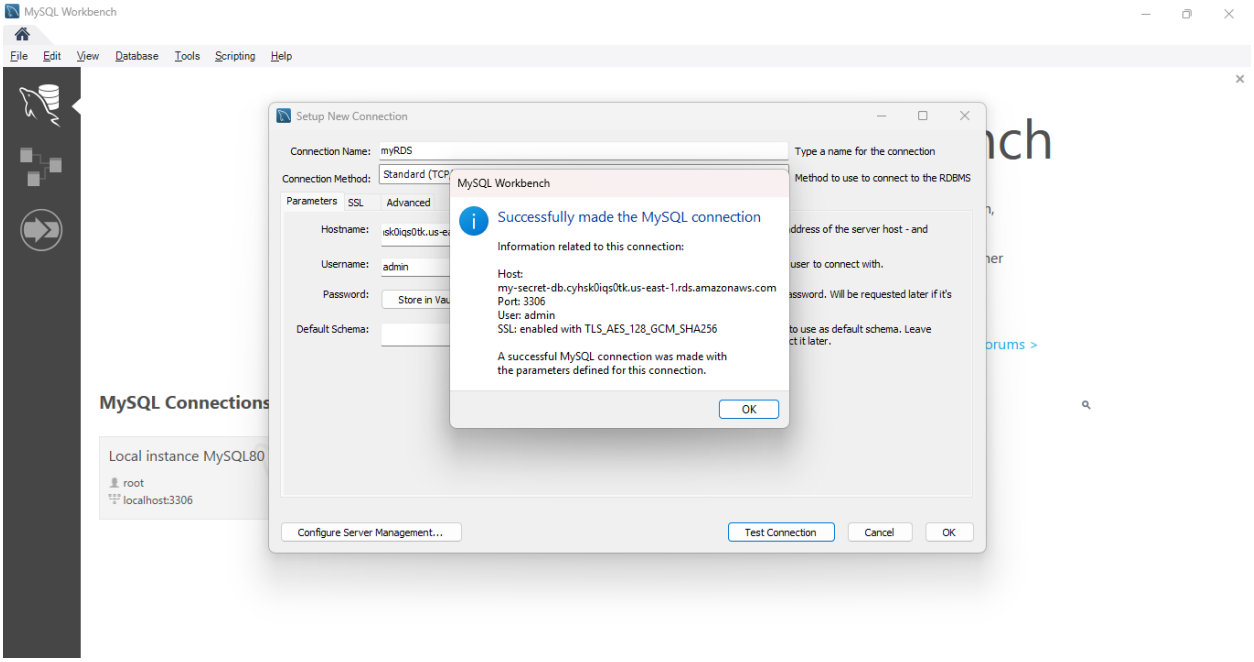

11. In the database instance copy the endpoint from the connectivity and security option.

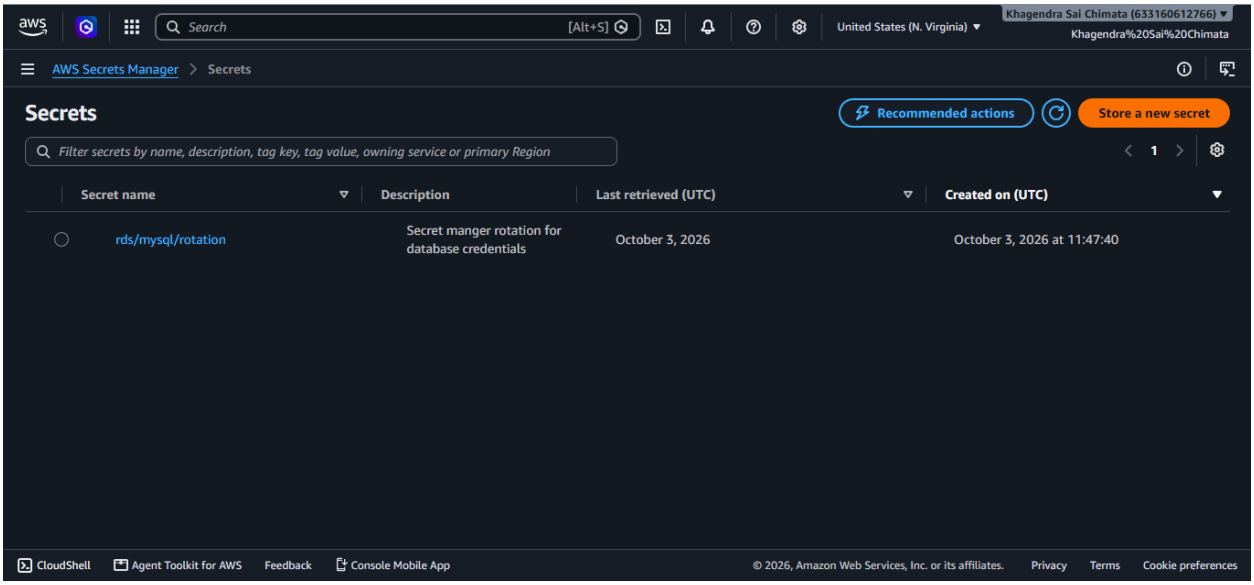

12. In MySQL Workbench set up a new connection and connect to the RDS instance using the Instance endpoint , username and password and click on test connection.

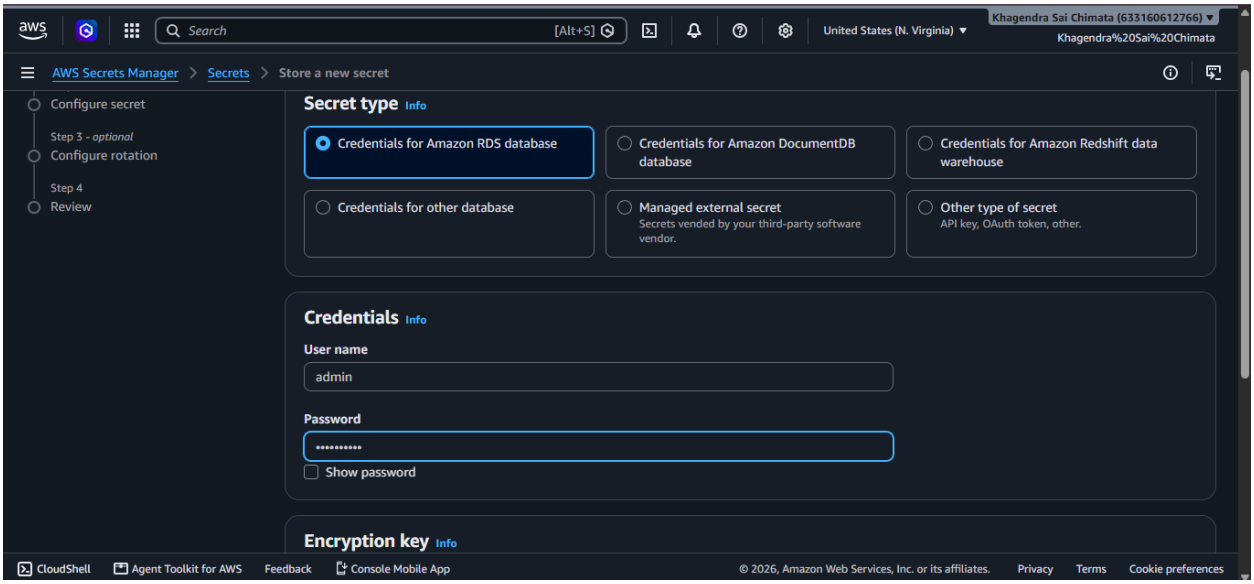

13. Successful Connection to RDS instance is made.

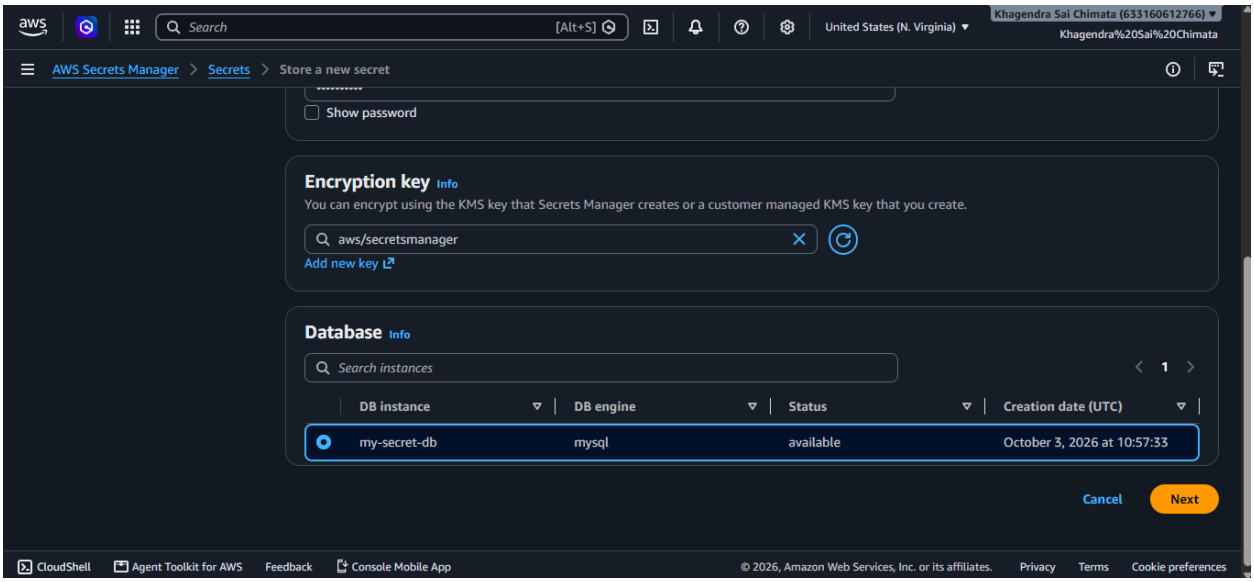

14.Open the AWS Secret Manager and store a new Secret .

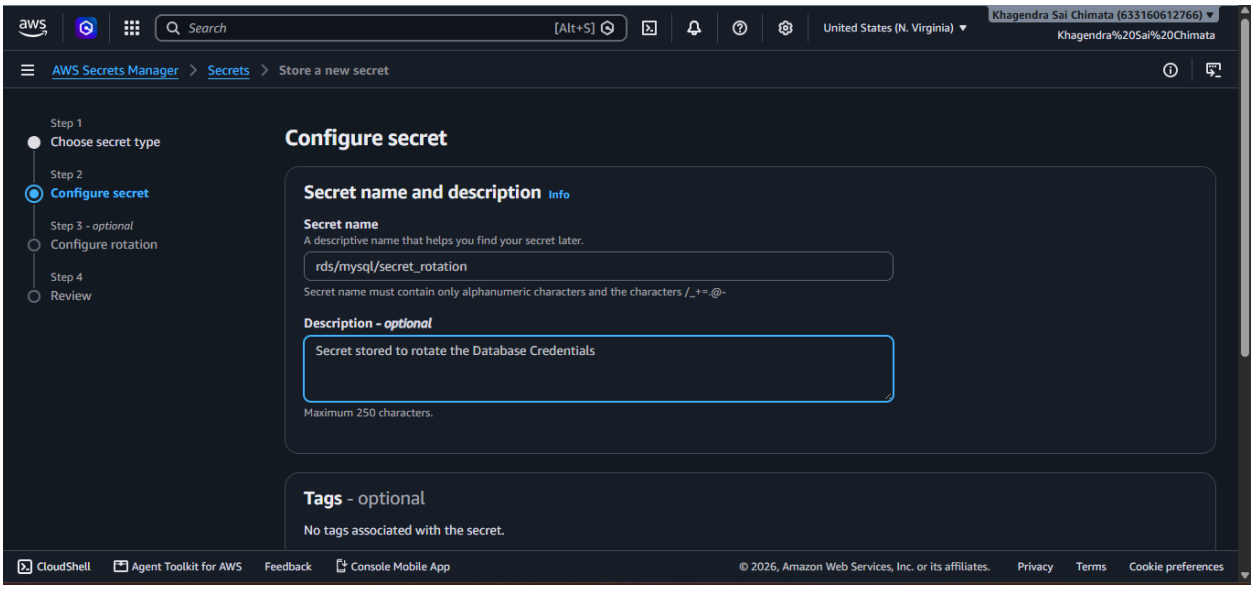

15. Select the Secret type and store the username and password.

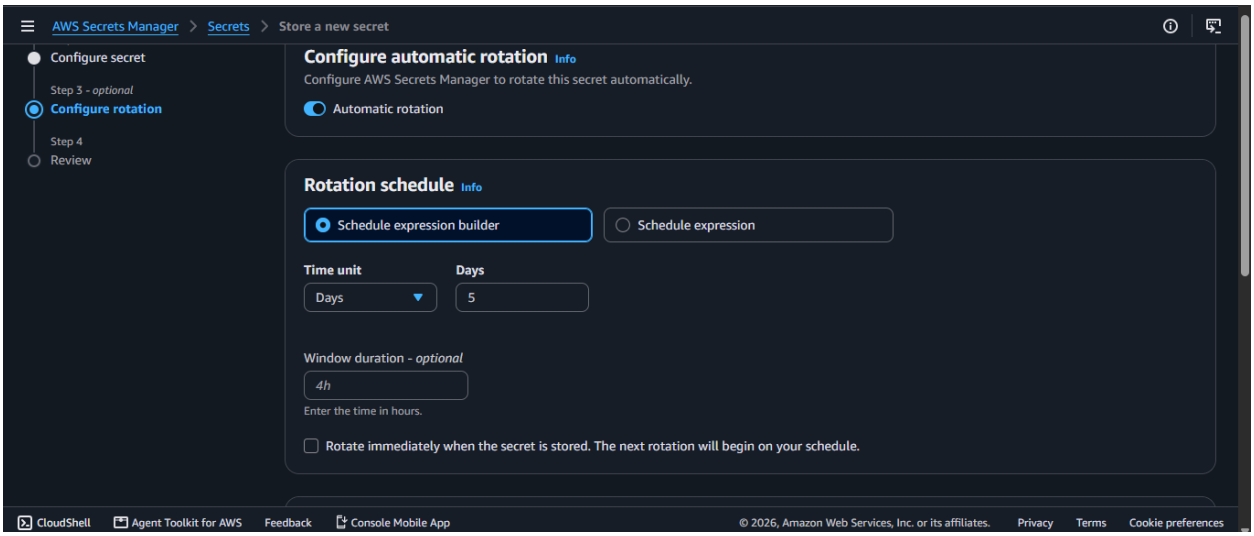

16. Select the Encryption key and select  the database and click on Next.

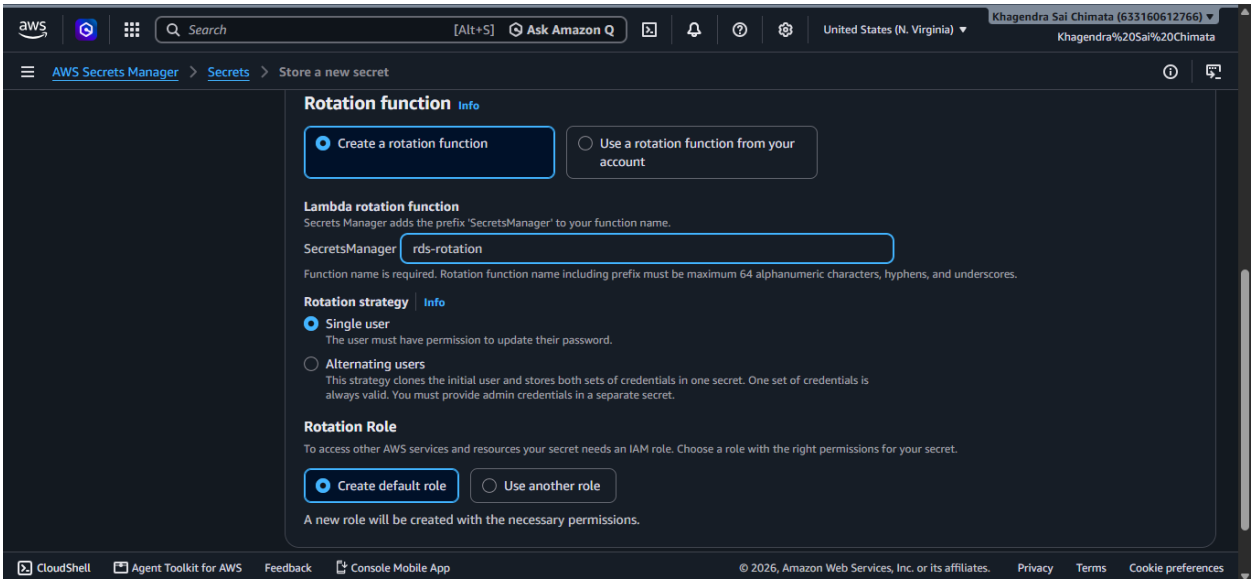

17. Configure the secret name and click on Next option.

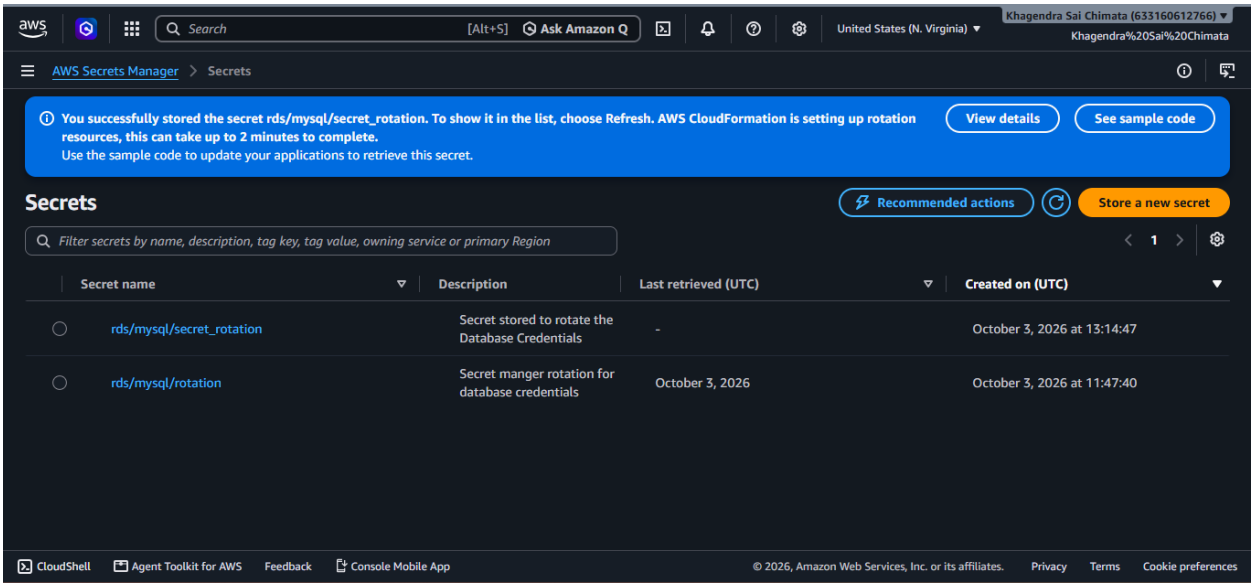

18. Select Automatic rotation and schedule the rotation such as per 5 days

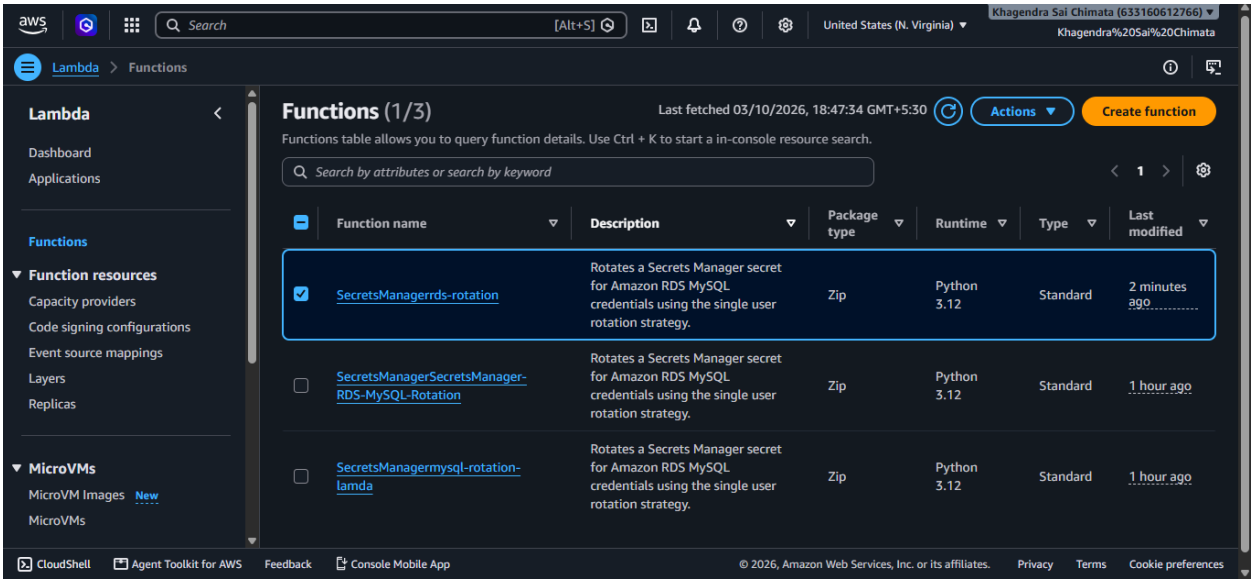

19. Select to Create the rotation function and give lambda function a name and select to create a rotation role and click on next and Store.

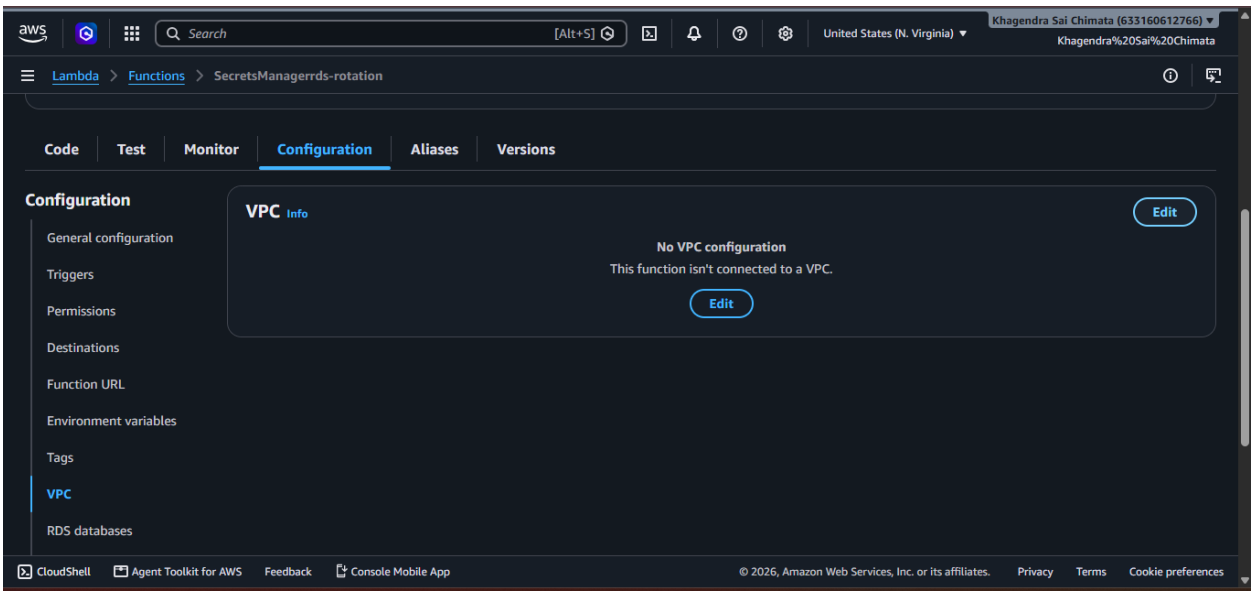

20. A new Secret is stored.

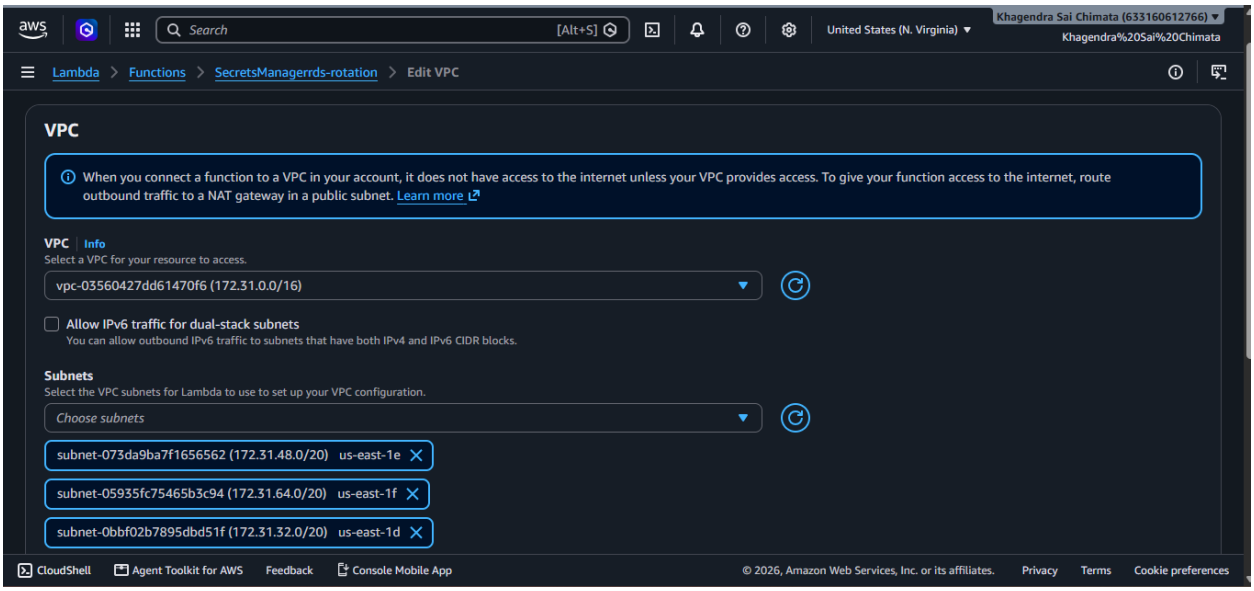

21.Open the Lambda function and select the lambda function now created.

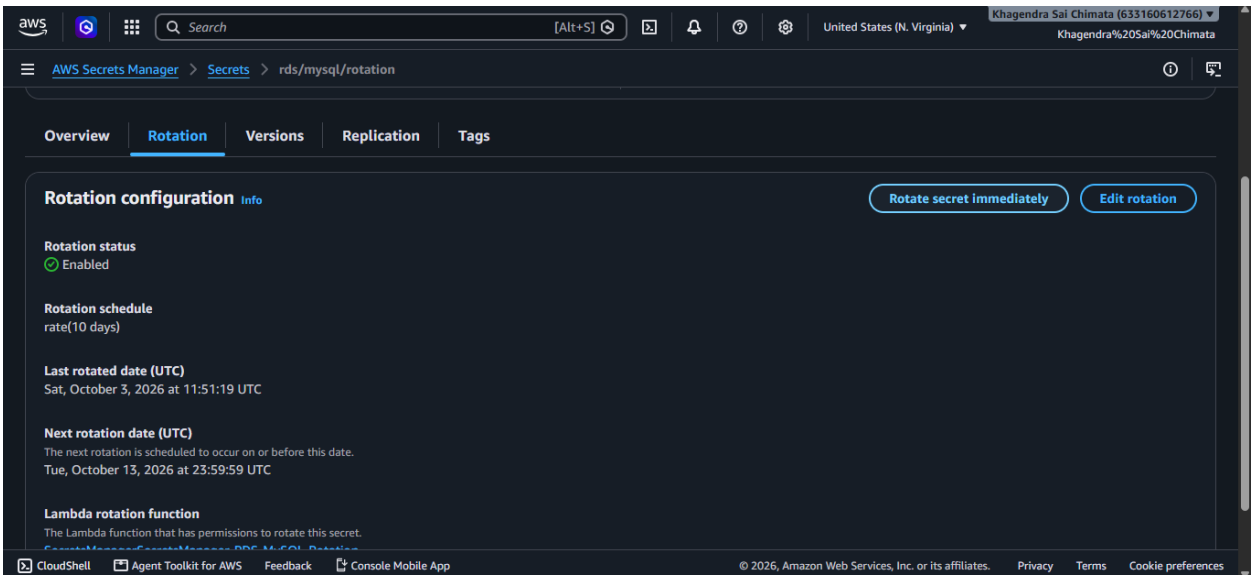

22. Open Configurations ---> VPC and click on edit .

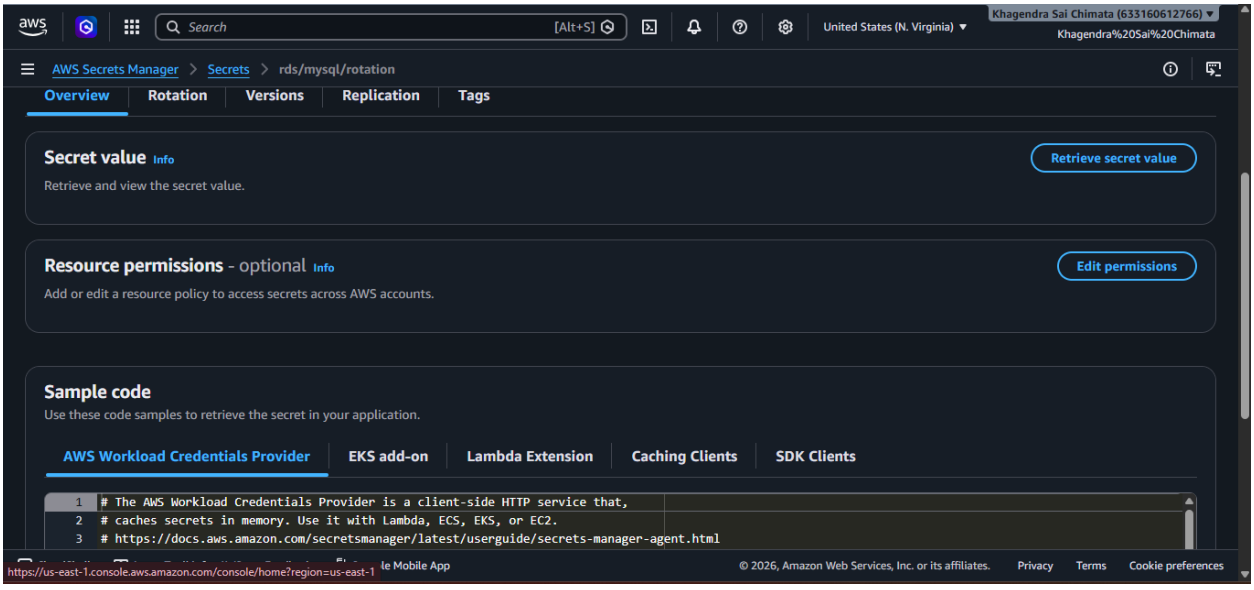

23. Select the VPC , Subnets and Security groups same as the RDS instance and click on Save

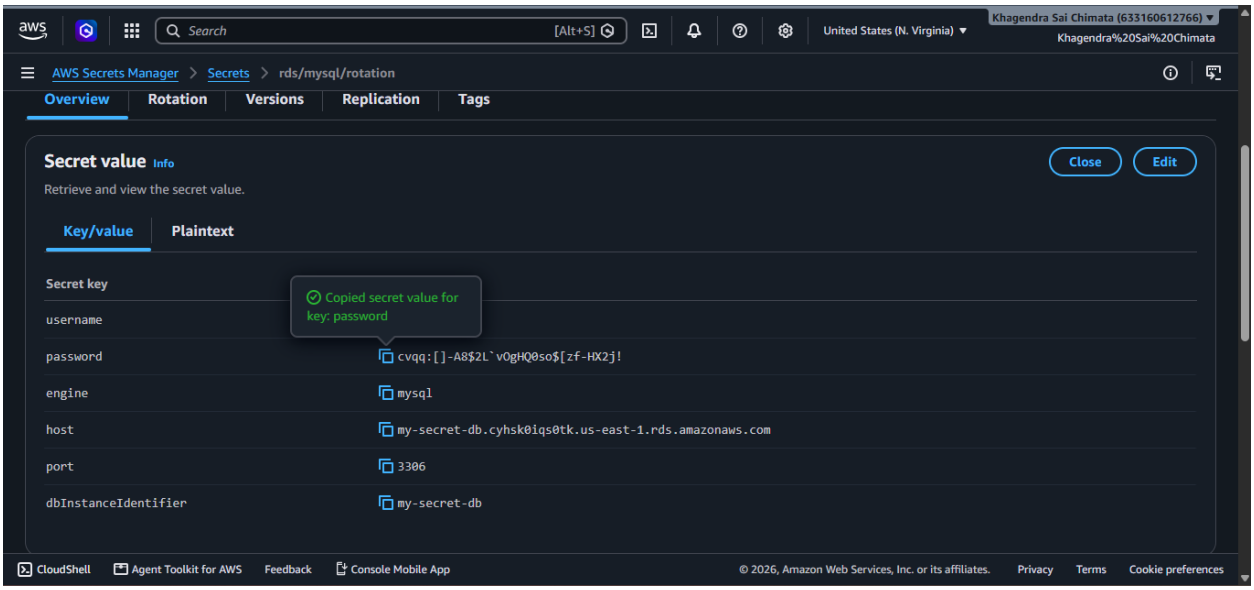

24. Open the AWS Secret Manager and open the created secret and select rotate secret Immediar;y option which would change the password for the RDS instance.

25. After rotation of Password retrieve the secret value.

26. Copy the newly changed Password to connect to the RDS Instance using MySQL workbench.

27. We can observe that by using the new password we can connect to the RDS instance.
